

Multifunctional luminary LICHT+

2000
Design/Object

A multifunctional built-in exterior lamp, which can take on a number of additional functions has been designed for the offices of Braun GmbH. This design offers the following advantages:

- A reduction in on-site construction costs
- A less dense matrix, which averts inhibiting scope for extensions
- High-precision assembly
- Precise control of the ceiling design

In these multifunctional built-in lights, the recess-fixed built-in housing consists of two separate chambers. The larger of these chambers contains the background lighting luminaire. The smaller is supplied with a sleeve that is pushed up to the top of the ceiling slab. Installation takes place through this sleeve. Depending on the geometrical layout, this second sleeve may house alarms, stop valves or sprinkler heads, as well as small halogen bulbs.
